

We highly recommend reading the entire Owner's Manual before installing your system, but for those who do not like to read manuals, **IF YOU READ NOTHING ELSE, PLEASE READ THE FOLLOWING:**

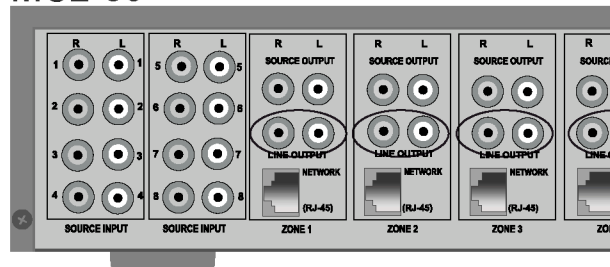

1. The connectors on the end of the Cat-5 cables **MUST** follow the **EXACT** sequence specified by IEEE T-568A or T-568B for ALL 8 WIRES (select only one sequence to use for your entire system). Even a single wire out of the correct left to right order of any of the Cat-5 connectors can cause the MC-86 and any or all of the Keypads to function improperly.

2. Set the Keypad zone selection button on every keypad to match the zone number in which it will be located **BEFORE** installing.

MC2-86

3. When setting the MA-1235 12-channel amplifier for use with the MC-86, make sure each channel is set to "Line" and that the Bridged switch is in the left (non-bridged) position.

4. For each zone, connect the "Line Output" on the MC-86 to the "Line In" inputs on the MA-1235. For consistency, we recommend using the odd-numbered channels on the MA-1235 for the "Right" and the even-numbered channels for the "Left". Only use the Source Outputs on the MC-86 when utilizing an audio source located within a zone.

MA-1235
